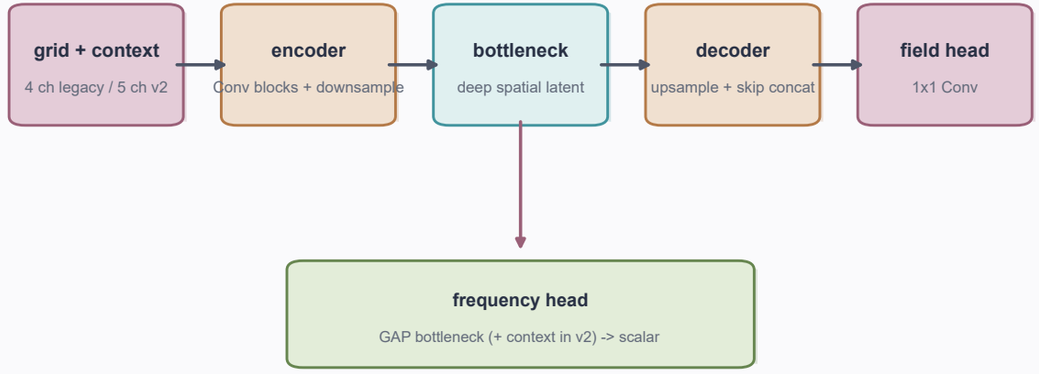
TE eigenfield models: spatial output plus scalar frequency

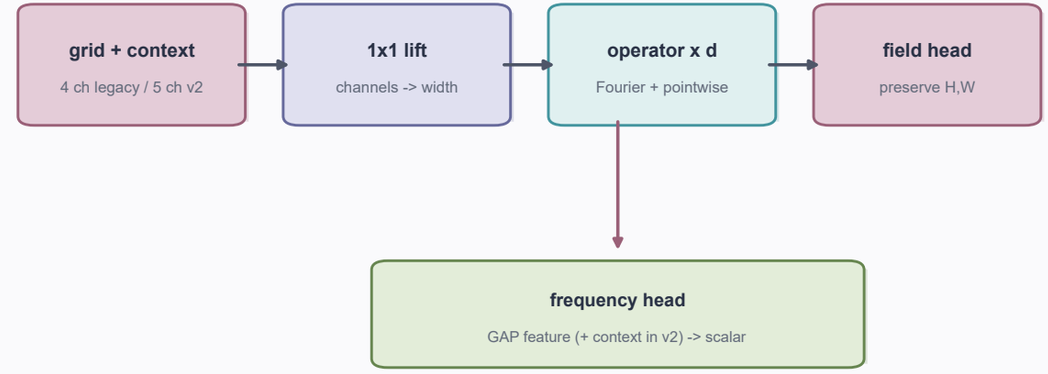
Legacy and v2 U-Net/FNO identities share the two-head task; v2 adds periodic handling, residual blocks and explicit field-context FiLM.

A | unet_field and unet_field_v2



v2: circular 3x3 Conv + GroupNorm + residual + FiLM in every block

B | fno_field and fno_field_v2



v2: +/- first-axis modes + GroupNorm + FiLM + residual update

C | What is and is not a separate architecture

unet_field
legacy supervised U-Net; width 32, depth 2

unet_field_v2
periodic conditioned residual U-Net; width 48, depth 3

fno_field
legacy data-only FNO field model; width 32, depth 4

fno_field_v2
conditioned FNO backbone; width 48, depth 4

adapted PINO reuses fno_field_v2 and changes the training loss/regime; it is not a fifth registered field architecture.
