Full-cell Full-Wh upgrades: five established encoders and one new bridge

Each encoder produces a global latent followed by the shared dense or k-conditioned band head. The new global-local model is expanded in the next figure.

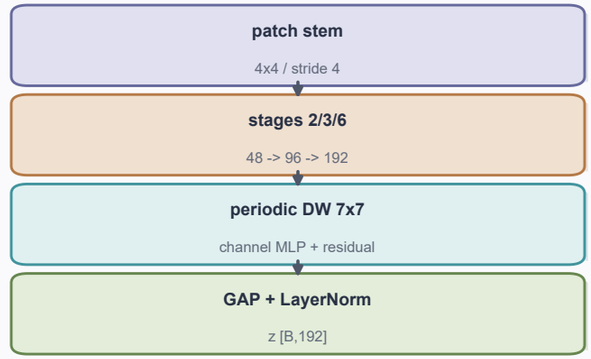

A | mlp_mixer_band_v1

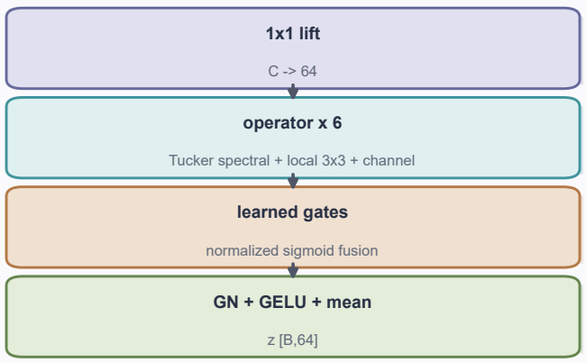

B | res_mlp_gated_v2

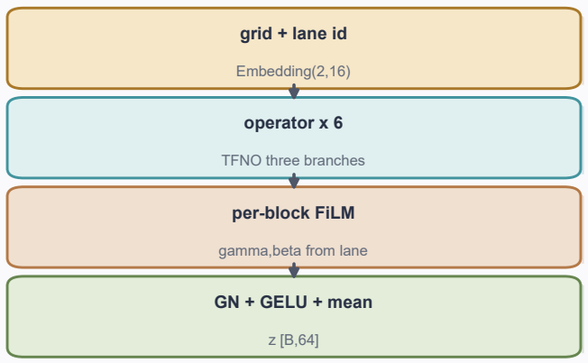

C | convnext_band_v1

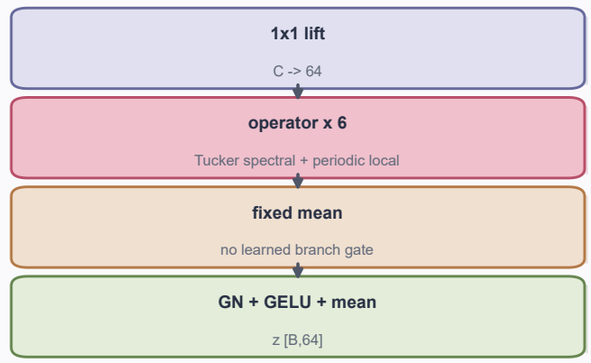

D | tfno2d_band_v3

E | dual_lane_band_operator_v1

F | global_local_band_operator_v1

All six default to material_weight_grid -> Wh[81,10]; only dual-lane accepts lane_id. Interface support for k_points is not unseen-k validation.
