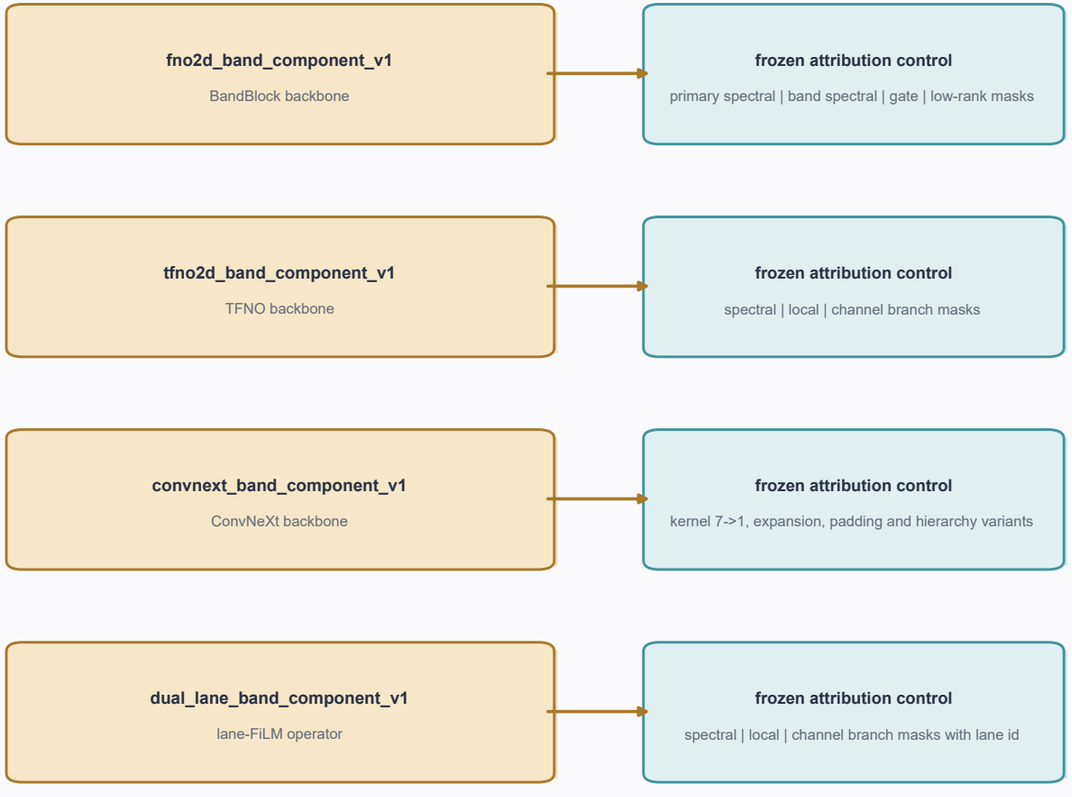
Component-attribution identities and implemented inverse generators

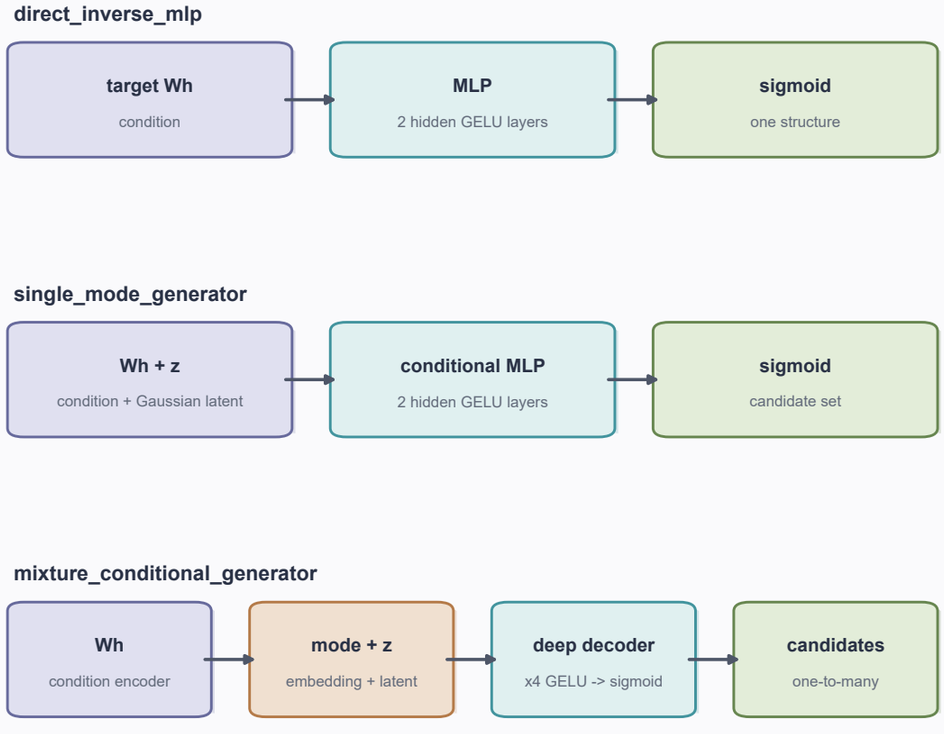
Left: four registered EXP-FWD-019 model identities. Right: three implemented inverse architectures that are not part of the forward-model registry.

A | Registered component-attribution models



These identities retain checkpoint/model provenance; validation-only component evidence is not held-out or physical validation.

B | Non-registry inverse architectures



adapted PINO = fno_field_v2 backbone + physics-informed training losses; it is a regime, not another architecture.
